summary

The Creation of a book on the Ministry of Artificial Intelligence in Morocco is a proposed scholarly project that would document and analyze Morocco's AI policy, governance, and regulatory framework as shaped by the Ministry of Artificial Intelligence and related national institutions. Framed within wider discussions about AI in Africa—including how AI technologies are diffusing through the publishing and education sectors—the project aims to synthesize policy analyses, governance models, and practical implications for public administration and digital transformation in Morocco.[1][2]

The proposed work seeks to map Morocco's AI policy landscape, including data sovereignty, transparency, human oversight, and high risk AI governance. It would examine legislative instruments such as Law No. 05-20 on Cybersecurity and related decrees, the role of the CNDP in data protection, and emerging governance mechanisms like regulatory sandboxes, algorithmic impact assessments, and pre deployment conformity checks. The project is positioned to illuminate how Morocco's

frameworks support public interest AI, innovation, and digital transformation while safeguarding security and rights, situating the Ministry's initiatives within national development and sovereignty goals.[2][2][3]

Academic and policy commentators have highlighted potential controversies and challenges that a Morocco focused AI governance volume would need to address. Central tensions include intellectual property and authorship in AI assisted publishing, the impact of AI on traditional publishing roles, and regional considerations about technology diffusion and equity in Africa. The proposed book would engage with these debates by presenting governance mechanisms, accountability structures, and human in the loop oversight drawn from international experience, while examining Morocco's unique regulatory and cultural context.[4][3]

As of the most recent available information, there is no published bibliographic record or release date for the book, and it remains a proposed project rather than a completed publication. The argument and framing of the work draw on analyses of AI in publishing, Africa focused digital governance, and Morocco's AI policy landscape, rather than on an existing, formally published Moroccan government monograph.[1-][5][4]

Lead

The article concerns the proposed creation of a book about the Ministry of Artificial Intelligence in Morocco, outlining its objectives, scope, and potential impact within the Moroccan technological and educational landscape. The project is framed by broader discussions in the publishing and AI ecosystems in Africa, where recent literature analyses how artificial intelligence is being integrated into the book publishing value chain and the educational publishing sector [1]. These analyses also note that adoption of AI tools in writing remains uneven, with many writers delaying adoption even as digital technologies accelerate production processes in large multinational publishing houses [1][5]. The discussion situates the Moroccan project within the Innovation Decision Process framework, which describes knowledge, persuasion, decision, implementation, and confirmation stages as central to the adoption of new technologies like AI [4]. The lead thus positions the proposed book as a synthesis of current scholarly insights on AI's role in publishing, technology diffusion, and policy-oriented considerations for a national AI ministry in the African and Moroccan contexts [4][5].

Purpose and scope

The book aims to document and analyze the development, governance, and regulatory framework of artificial intelligence in Morocco, with a focus on how the Ministry of Artificial Intelligence shapes policy, implementation, and oversight across public and private sectors [2]. It seeks to situate Morocco's AI trajectory within broader regional and international discussions on data sovereignty, transparency, human oversight, and the governance of high-risk AI applications [2].

Key objectives include mapping the legislative and regulatory instruments governing AI and cybersecurity, detailing the roles and responsibilities of national institutions, and assessing how Morocco's frameworks support public-interest AI models, innovation, and digital transformation while maintaining trust and security [2]. The volume also aims to identify governance gaps, opportunities for stakeholder engagement, and practical implications for policymakers, industry, educators, and civil society [2].

In terms of scope, the book covers legislation and policy instruments such as Law No. 05-20 on Cybersecurity and its operationalization through Decree No. 2-21-406, including requirements for data residency, periodic compliance audits, and incident reporting for Entities of Vital Importance (OIV) [2]. It discusses proposed governance mechanisms that emphasize data sovereignty, regulatory sandboxes, mandatory algorithmic impact assessments, explainability requirements, and pre-deployment conformity assessments, as part of a flexible, national infrastructure approach to supporting public-interest AI and small-scale innovation [2]. The work also incorporates evaluative materials and national assessments related to Morocco's AI readiness and policy landscape to provide a comprehensive reference for understanding how the Ministry's initiatives fit within national development goals and the pursuit of digital sovereignty [6].

Background

Morocco has positioned digital transformation and AI governance at the center of its development strategy, integrating the transformation of public administration and critical infrastructure within the broader Maroc Digital 2030 framework and the Administration X.0 program [5]. The kingdom emphasizes data sovereignty and data localization as core principles, with Law No. 05-20 on Cybersecurity mandating national data residency for sensitive information systems and critical data, and establishing security baselines, biennial audits, and incident reporting for Entities of Vital Importance (OIV) [2]. In this context, proposed AI governance measures—such as the Digital X.0 Framework Law and the Bill for the Establishment of the National Agency for AI Governance—are designed to function as enabling frameworks that complement sectoral legislation by providing unified standards for interoperability and data governance while respecting sector-specific constraints [1][2].

The governance approach prioritizes data sovereignty, public transparency, and human oversight, with high-risk systems or those involved in automated decision-making facing obligations such as algorithmic impact assessments, mandatory logging, explainability requirements, and pre-deployment conformity assessments. The framework also contemplates regulatory sandboxes and shared national infrastructure to support public-interest models and incremental innovation [2]. Enforcement powers envisioned under the National Agency for AI Governance include pre-deployment inspections, mandatory algorithmic audits, orders for technical remediation, and the ability to suspend or withdraw non-compliant AI systems, along with administrative fines and formal complaint channels for individuals affected by automated decisions [2].

Leadership for these initiatives has been articulated by key figures in Morocco's digital governance landscape. The initiative is being led by Amal El Fallah Seghrouchni, the Minister of Digital Transition and Administration Reform, with ongoing collaboration across ministries and agencies [7]. The Ministry of Digital Transition and Administrative Reform has also advanced the construction of a dedicated AI governance framework in concert with other national bodies, as reflected in collaborations and announcements involving Mistral AI and related governance efforts [8]. In the political sphere, Ahmed Rahhou's involvement as Minister of Artificial Intelligence and the broader cabinet alignment under the King's oversight signal a high-level prioritization of AI policy, governance, and the reform of the public administration [9].

Morocco's approach also intersects with international alignment and national privacy protections, as the CNDP (Commission Nationale de Contrôle de la Protection des Données à Caractère Personnel) oversees data protection and privacy safeguards across digital and AI systems, with proposed AI legislation explicitly incorporating CNDP terminology and compliance with national data processing standards and privacy-by-design principles [2]. The ongoing development of the regulatory framework includes anticipated executive decrees, technical rulemaking, and national certification schemes to operationalize AI governance, including registration regimes, standards for algorithmic explainability, and national AI infrastructure for public-interest applications [2].

Project and development (as reported)

The book project, focused on the Ministry of Artificial Intelligence in Morocco, is situated within a broader trajectory of digital governance reforms initiated after the adoption of the 2011 Moroccan Constitution, which laid a groundwork for more structured digital governance and related publications by the General Directorate/Policy Brief publications [5]. This context frames the project as part of ongoing efforts to publish authoritative materials on national digital strategy and AI policy.

In terms of production and dissemination, the evolution of publishing in the digital era—characterized by shifts from print to digital formats, new business models, and the rise of self-publishing and reader-created content—informs the project's approach to content creation and distribution. The World Intellectual Property Organization (WIPO) notes that such changes affect how publications are produced, priced, promoted, and distributed, which in turn influences the design of the book and its accompanying digital assets. These developments underscore the need to rethink traditional publishing hierarchies and gatekeepers in the Moroccan context as the project moves forward [1].

Methodologically, the project appears to align with established innovation diffusion frameworks. The Innovation Diffusion Theory (IDT) outlines a five-step decision process—knowledge, persuasion, decision, implementation, and confirmation—guiding stakeholders through awareness, evaluation, and adoption of new technologies. This framework helps structure the book's reporting on AI policy adoption, governance, and implementation strategies, including how policymakers and publishers assess advantages, risks, and readiness for AI-enabled processes [1]. The process suggests

that content development, acquisition, and implementation should be informed by trusted sources and robust stakeholder engagement, with a technical support system to address deployment issues as they arise [1].

In its recommendations and prospective development, the project advocates for ongoing professional upskilling to keep pace with rapidly evolving AI-enabled roles in publishing and governance, active participation by stakeholders in policy formulation governing AI usage, and targeted future research on AI adoption in Africa—particularly Southern and North African contexts—to gain deeper insights into how AI is being integrated into publishing and public-sector workflows [1]. These directions reflect a broader recognition of the transformative potential of AI in the publishing value chain, including content development, authorship, translation, and copyright management, while acknowledging that African publishers' use of AI remains nascent relative to some Global North contexts [1].

Content design

Content design for the Creation of a book on the Ministry of Artificial Intelligence in Morocco should align with best practices observed in AI-enabled publishing and content development. The work should articulate clear objectives, define audience needs, and establish an editorial framework that supports accurate representation of policy, governance, and technical guidance. Informed by studies on technology integration in publishing, the design should foreground content development, authorship, and translation processes as core design considerations [4]. [4]

The structure should be modular and navigable, enabling readers to access policy descriptions, historical context, institutional roles, and implementation case studies of AI initiatives in Morocco. A modular approach mirrors how AI-assisted publishing environments optimize workflows, reduce costs, and improve content quality by automating routine tasks while preserving human editorial oversight [1]. [1]

Editorial policy should address sourcing, originality, and integrity, including how official government information and expert analyses are incorporated. The sources emphasize ethical standards and the responsibility of publishers to credit authors and institutions while ensuring that the published material reflects diverse scholarly perspectives and up-to-date developments [4]. [4]

Language, translation, and localization are essential design components, given the multilingual audience for Moroccan AI governance. The design should specify processes for translation and adaptation of technical material, ensuring accuracy and accessibility across Arabic, French, and potentially English-language readers. The literature on content development and translation within AI publishing highlights the importance of rigorous secondary research and careful editorial judgment to maintain quality in translated outputs [4]. [4]

Incorporating accessibility considerations is also important in content design. The aim should be to produce formats suitable for different reading modalities and to facilitate reuse under licensing terms that acknowledge authorship and the Moroccan government authorities involved. The cited discussions on digital publishing emphasize

the transformative potential of AI tools to assist in editing, proofreading, and content production, while maintaining ethical and legal safeguards [1]. [1]

Finally, the content design should anticipate updates and ongoing governance needs as Morocco's AI landscape evolves. A forward-looking editorial plan can integrate new developments, policy shifts, and technical standards by embedding a living appendix or dedicated update sections, reflecting the dynamic nature of AI policy and implementation in the public sector [4]. [4]

Publication status and bibliographic details

As of the collected information, there are no publication status updates or bibliographic details available for a book specifically titled or focused on the Ministry of Artificial Intelligence in Morocco. The gathered sources pertain broadly to artificial intelligence in publishing and educational book value chains in Africa, rather than to a Morocco-focused government publication. Consequently, there is no reported publication date, publisher, ISBN, edition information, or distribution details to cite for such a work [5][4][1].

Structure of the book (proposed or reported)

The proposed book on the Ministry of Artificial Intelligence in Morocco is organized around a structured table of contents that reflects both legal and policy dimensions as well as practical implications for public decision-makers. The backbone includes an initial introduction followed by major parts and chapters that address the Moroccan digital and AI legal corpus, and the strategic stakes of artificial intelligence in the country. The layout echoes the described table of contents, beginning with a comprehensive introduction and then a two-part framework: I) Le corpus juridique digital et numérique marocain, and II) Les enjeux de l'intelligence artificielle au Maroc [5].

A core aim of the book is to offer a Moroccan and systemic reading of artificial intelligence designed for public decision-makers and coherent policy-making, with emphasis on how international commitments translate into domestic practice [10]. The structure is thus designed to situate Morocco within the global discourse on AI governance while highlighting national legal and regulatory developments [10].

The book is expected to blend theoretical literature review with practical findings, including tables and figures such as Table 1 and Figure 1 that summarize literature review results and key considerations for policy [4]. In keeping with contemporary publishing trends noted in recent analyses of digital publishing, the work envisions a dynamic content development process, potentially involving authorship and translation decisions that reflect evolving technologies and cross-border considerations [1].

Specific topics anticipated within the sections may address the traditional and modern publishing value chain in the context of AI policy, from editorial oversight and authorship to translation and dissemination, illustrating how digital transformation impacts the production of legally and policy-relevant material in Morocco [4][1]. The publication also aligns with recognized industry practices where major publishers impose stringent compliance requirements, a consideration that informs how the

book treats contractual governance and regulatory conformity in the Moroccan AI domain [11][12].

Reception and impact (if published)

If a book detailing the Ministry of Artificial Intelligence in Morocco were published, its reception could be shaped by ongoing debates about the governance of artificial intelligence and its implications for rights, public services, and industry in Africa and beyond. Proponents might view the work as a timely contribution to policy discussions on AI regulation, public sector use, and the balancing of innovation with fundamental rights. In particular, analyses of state responses to disinformation, hate speech, and violent extremism—including regulatory pressures on platforms to remove content quickly—could provide a concrete context for Morocco's own AI governance debates and potential policy learnings [5]. Such a focus would likely resonate with policymakers, researchers, and civil society organizations seeking to understand how rapid content moderation and automated decision making interact with freedom of expression and due process [5].

In the publishing and educational sectors, the book could be read against broader trends in AI adoption within the publishing value chain and in public educational publishing in Africa. Scholarly and industry literature notes that AI has begun to permeate all stages of publishing, from content acquisition and development to distribution and marketing, while also highlighting regional disparities in adoption—Africa showing more limited use of AI for content decision making compared to parts of the Global North and China [1]. A Moroccan case study might therefore contribute to discussions on technology diffusion, capacity building, and the equitable deployment of AI tools in education and publishing within the region [1]. The work could also foreground concerns about equity and access, given discussions of how algorithmic filtering, social media dynamics, and data analytics shape publishing, content discovery, and dissemination for various audiences in Africa [1].

Critics and academics might challenge claims regarding the transformative potential of AI in governance and public safety, emphasizing risks to civil liberties such as overreach by automated systems, autocomplete-style misclassifications, and the possibility of errors in rapid content removal or risk assessment processes [5]. The book could address these critiques by presenting governance frameworks, accountability mechanisms, and human oversight strategies drawn from international experience, thereby contributing to an informed debate on how Morocco can harness AI responsibly without eroding fundamental rights [5].

Controversies and challenges

Several controversies and challenges surround the proposed Creation of a book on the Ministry of Artificial Intelligence in Morocco, reflecting broader debates about AI adoption, intellectual property, data protection, and regulatory governance in the publishing context.

Intellectual property rights concerns and authorship

The shift toward AI-assisted publishing raises questions about authorship, ownership, and originality of AI-generated content, with scholars highlighting the need to determine who holds rights to AI-aided works and how to credit human versus machine contribution [4]. This aligns with broader discussions on authorship and inventorship in AI-generated works, which have been explored in the African publishing literature and related legal analyses [1].

Impacts on the traditional publishing value chain

Analyses of the publishing ecosystem note that AI can disrupt traditional roles—from commissioning editors and authors to editors, proofreaders, and distributors—creating tensions around responsibility, quality control, and economic viability [4]. While AI can streamline production and reduce costs, stakeholders worry about quality, accountability, and the potential marginalization of human expertise [4][1].

Methodological and regional considerations

The implementation of AI in educational book publishing has predominantly been studied via qualitative literature reviews focusing on Africa, with attention to how digital technologies transform publishing practices, access, and equity [4]. The need for context-specific data, ongoing monitoring, and transparent methodologies is emphasized to avoid biases and to capture diverse regional perspectives [4][1].

Legal and regulatory environments in Morocco

The Moroccan legal framework seeks to harmonize data protection and digital governance with international standards, incorporating preventive and punitive measures to safeguard rights in the digital realm while acknowledging economic constraints. This creates a complex environment for AI-enabled publishing projects, particularly regarding data handling, biometric access controls, and surveillance in workplaces, all of which bear on the creation and distribution of AI-assisted educational materials [5][3].

Governance challenges and policy updates

The government has signaling powers to regulate digital information flows, including expansion of ministry responsibilities to address fake news and industry support, which could influence how AI-driven publishing initiatives are supervised, funded, and evaluated [3]. This evolving governance landscape introduces uncertainty about timelines, compliance burdens, and strategic priorities for educational publishing projects in Morocco.

Attitudinal and adoption barriers

Acceptance or rejection of AI-enabled innovations in publishing often hinges on the attitudes of individuals within academic and publishing communities, impacting the speed and manner of adoption, investment decisions, and the perceived legitimacy of AI-assisted authorship and editing processes [4].
